

TECHNICAL SUMMARY

-AI POWERED QUIZ PLATFORM (PROTOTYPE)

PROBLEM STATEMENT

AI Quiz Portal (Platform Replication(like Kahoot) with AI Quiz Generation)

The objective is to build an AI-powered quiz platform capable of generating quizzes from inputs such as topics, text, or documents.

Users should be able to create quizzes, host quiz sessions, join using a session PIN, and play interactively.

The prototype must demonstrate core AI logic, backend processing, quiz creation workflow, and an operational user interface.

APPROACH AND AI COMPONENTS

- Implemented AI quiz generation using the Groq LLM for topic-based MCQs.
- Created structured JSON-driven prompts to ensure clean, validated MCQ output.
- Integrated backend API endpoints that communicate with the AI system and store quizzes in the database.
- Prototype includes foundation for future enhancements:
 - PDF/Text → quiz conversion
 - Adaptive difficulty
 - Analytics engine

TECHNICAL ARCHITECTURE

Frontend:

HTML, CSS, and JavaScript-based prototype with interfaces for quiz creation, AI quiz request, hosting, and quiz-playing.

Backend:

Node.js + Express application handling quiz APIs, user sessions, authentication, and AI integration.

Database:

MongoDB stores quizzes, users, ratings, game history, and session data.

AI Layer:

Groq API generates dynamic multiple-choice questions from topics.

System Flow:

User Input → Backend API → AI Engine → Quiz Generation → Stored in MongoDB → Played via UI

CHALLENGES AND MITIGATIONS

AI Output Reliability

AI sometimes generated inconsistent JSON.

Mitigation: Improved prompts and added JSON validation.

Real-Time Gameplay (Not in Prototype)

WebSocket-based multiplayer is not yet implemented.

Mitigation: Session PIN flow added; sockets planned for final build.

PDF/Text Quiz Generation

Only topic-based AI generation is available.

Mitigation: Designed pipeline for text extraction and OCR for next phase.

Scalability

Final system must support many concurrent users.

Mitigation: Backend structured modularly for microservice expansion.

ROADMAP TO FINAL BUILD

Phase 1 – Core System (Completed):

Authentication system (Email/Google/Facebook), complete Dashboard UI, AI Quiz Generator, Manual Quiz Builder, Quiz Player (timer + scoring + results), Local Hosting prototype, MongoDB data models.

Phase 2 – Platform Polish (Near Completion):

Smooth animations, improved login experience, dashboard refinement, stable state management, optimized localStorage flow, cleaner backend routes.

Phase 3 – Competitive Features (Planned Next):

Real-time battle mode (1v1/2v2), host controls, synced questions, team scoring.

Phase 4 – Growth Systems:

Enhanced rating logic, XP/level progression, leaderboard upgrades.

Phase 5 – Community Expansion:

Public quiz library, tagging system, search filters, shareable quizzes.
